Learning Styles

I believe learning styles are extremely important especially when it comes to how each individual learns in correlation to the learning style itself. The point of learning styles is due to the fact that all individuals intake information differently. Some find it far easier to do a task after visually seeing the directions. Others will succeed after reading it, and some even prefer just hearing it. If we based a learning curriculum on simply one learning style, it would mitigate the results as a whole and demonstrate outliers in terms of achievement. On top of that, a variety of learning styles encourages more engagement, which is also a crucial component to learning and achieving a high rate of success. Furthermore, a proper learning style can promote more learning retention, which is arguably more important than just digesting the information itself.
